                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -!- CATALYTIC ACTIVITY: Inosine 5'-phosphate + NAD(+) + H(2)O = xanthosine 5'-phosphate + NADH.
-!- PATHWAY: FIRST REACTION UNIQUE TO GMP BIOSYNTHESIS.
-!- SUBUNIT: HOMOTETAMER.
-!- TISSUE SPECIFICITY: IMP TYPE I IS THE MAIN SPECIES IN NORMAL LEUKOCYTES AND TYPE II PREDOMINATES OVER TYPE I IN THE TUMOR.
-!- SIMILARITY: TO OTHER EUKARYOTIC AND PROKARYOTIC IMPDH AND TO GMP REDUCTASE.
                                                                                           01-FEB-1991 (Rel. 17, Last sequence update)

Submitted (AUG-1993) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: IMP IS THE RATE LIMITING ENIYME IN THE DE NOVO SYMTHESIS
OF GUANINE NUCLECTIDES AND THEREFORE IS INVOLVED IN THE REGULATION
OF CELL GROWTH. IT MAY ALSO HAVE A ROLE IN THE DEVELOPMENT OF
MALIGNANCY AND THE GROWTH PROGRESSION OF SOME TUMORS.
-!- CATALYTIC ACTIVITY: Inosine 5'-phosphate + NAD(+) + H(2)O =

"Crystal structure of human type II inosine monophosphate
dehydrogenase: implications for ligand binding and drug design.";
the converse of sci. U.s., 96:351-3536(1999).

C. I. FUNCTION: IMP IS THE RATE LIMITING ENZYME IN THE DE NOVO SYNTHESIS
C. OF GUANINE NUCLEOTIDES AND THEREFORE IS INVOLVED IN THE REGULATION
C. CELL GROWTH. IT MAY ALSO HAVE A ROLE IN THE DEVELOPMENT OF
MALIGNANCY AND THE GROWTH ROCRESSION OF SOME TUMORS.
C. I. CATALYTIC ACTIVITY: Inosine 5'-phosphate + NaD(+) + H(2)0 =
Xanthosine 5'-phosphate + NaDH.
C. I. SUBUNIT: HOMOTETRAMER.
C. I. SUBUNIT: SIMPLANDER IN TYPE I IS THE MAIN SPECIES IN NORMAL
C. I. PTM: The N-terminus is blocked.
C. I. SIMILARITY: TO OTHER BUKARYOTIC AND PROKARYOTIC IMPDH AND TO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright. J. Biol. Chem. 263:15769-15772(1988).
-!- FUNCTION: IMP IS THE RATE LIMITING ENZYME IN THE DE NOVO SYNTHESIS
OF GUANINE NUCLEOTIDES AND THEREFORE IS INVOLVED IN THE REGULATION
OF CELL GROWTH. IT MAY ALSO HAVE A ROLE IN THE DEVELOPMENT OF
MALIGNANCY AND THE GROWTH PROGRESSION OF SOME TUMORS.
-!- CATALYTIC ACTIVITY: Inosine 5'-phosphate + NADH.
-!- PATHWAY: FIRST REACTION UNIQUE TO GMP BIOSYNTHESIS.
-!- SUBUNIT: HOMOTETRAMER.
-!- SIMILARITY: TO OTHER EUKARYOTIC AND PROKARYOTIC IMPDH AND TO
GMP REDUCTASE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Biophys. Acta 1217:156-162(1994).

-1- FUNCTION: IMP IS THE RATE LIMITING ENZYME IN THE DE NOVO SYNTHESIS OF GUANINE NUCLEOTIDES AND THEREPORE IS INVOLVED IN THE REGULATION OF CELL GROWTH. IT MAY ALSO HAVE A ROLE IN THE DEVELOPMENT OF MALIGNANCY AND THE GROWTH PROGRESSION OF SOME TUMORS.
-1- CATALYTIC ACTIVITY: Inosine 5'-phosphate + NAD(+) + H(2)O =
Tiedeman A.A., Smith J.M.;
"Isolation and sequence of a cDNA encoding mouse IMP dehydrogenase.";
Gene 97:289-293(1991).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Bacteriol. 179:2331-2338(1997).
-!- FUNCTION: ESSENTIAL BUXNE IN THE DE NOVO BIOSYNTHESIS OF GMP,
CATALYSING THE NAD-DEPENDENT OXIDATION OF IMP TO XMP.
-!- CATALYTIC ACTIVITY: Inosine 5'-phosphate + NAD(+) + H(2)0 =
Anthosine 5'-phosphate + NADH.
-!- PATHARY: FIRST REACTION UNIQUE TO GMP BIOSYNTHESIS.
-!- DEVELOPMENTAL STAGE: EXPRESSED AT EQUAL LEVELS IN THE YEAST OR
                                                                                                                                                                                                                                                                                                                                                                                                                           SIMILARITY: TO OTHER EUKARYOTIC AND PROKARYOTIC IMPDH AND TO GMP REDUCTASE.

-!- FUNCTION: IMP IS THE RATE LIMITING ENZYME IN THE DE NOVO SYNTHESIS OF GUANINE NUCLECTIDES AND THEREFORE IS INVOLVED IN THE REGULATION OF CELL GROWTH (BY SIMILARITY).

-!- CATALYTIC ACTIVITY: Inosine 5'-phosphate + NADH.

-!- PATHWAY: FIRST REACTION UNIQUE TO GMP BIOSYNTHESIS.

-!- STAILARITY: TO OTHER EUKARYOTIC AND PROKARYOTIC IMPDH AND TO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   brucei gambiense due to an increase in chromosome copy number.";

-!- CATALYTIC ACTIVITY: Inosine 5'-phosphate + NAD(+) + H(2)0 = xanthosine 5'-phosphate + NADH.

-!- PATHWAY: FIRST REACTION UNIQUE TO GMP BIOSYNTHESIS.

-!- SIMILARITY: TO OTHER EUKARYOTIC AND PROKARYOTIC IMPDH AND TO GMP REDUCTASE.
